Education

University of Waterloo Sep. 2024 – Present
BASc in Biomedical Eng, Option in Software Eng, President Scholarship of Distinction, 3.9 GPA *Waterloo, ON*

Technical Skills

Languages: Python, TypeScript, JavaScript, C++, C, Java, SQL, Bash, HTML/CSS, MATLAB
Frameworks & Libraries: React, Next.js, Node.js, FastAPI, PyTorch, TensorFlow, scikit-learn, Playwright, Vercel AI SDK
Tools & Technologies: AWS, Docker, Terraform, PostgreSQL, Redis, MongoDB, Supabase, GitHub Actions, Linux, Datadog

Experience

Software Engineer Sep 2026 – Present
Courtyard AI *Toronto, ON*

- Designed a durable scheduling engine that runs recurring AI agent tasks for business owners at under **6¢** per run.
- Built isolated per-user sandboxes on Modal so the agent can safely run code and edit files, passing **18/18** evals.
- Rebuilt browser-agent recovery so failed steps resume instead of silently stalling, eliminating **64** audited stalls.
- Built an end-to-end eval suite testing the live agent on **52** scenarios with an LLM judge panel, catching **5** launch bugs.

QA Engineer Jan 2026 – Apr 2026
Relay Financial *Toronto, ON*

- Engineered an AWS Lambda test account generator with DynamoDB and S3, saving **$25K** in annual testing costs.
- Developed a React/Vue.js/TypeScript platform powering bug bashes and release workflows for **80+ engineers**.
- Built GitHub Actions and Jira integrations to automate test tracking and bug reporting, saving **5+ hours/week**.

Software Engineer in Test May 2025 – Aug 2025
RideCo On-Demand Transit *Waterloo, ON*

- Shipped Python/Django features for a production AI transit agent across behaviour, routing, and admin configuration.
- Reduced LLM costs by **70%** via dynamic model routing, prompt token optimization, and context window tuning.
- Built an LLM eval framework (simulated users, LLM judge, tool-call judge) that gated agent changes before release.

Machine Learning Engineer Sep 2024 – Apr 2025
Biomechatronic Design Team *Waterloo, ON*

- Built a TensorFlow pipeline classifying 8 hand gestures from wavelet-denoised EMG at **91.6% test accuracy**.
- Developed a Matplotlib + Tkinter tool for real-time EMG signal visualization, used by the team for debugging.

Projects

Avesia – Winner at NexHacks | ***React, FastAPI, Python, MongoDB, OpenCV, Tailwind***

- Built a no-code platform enabling non-technical users to compose and deploy real-time AI surveillance pipelines.
- Architected a full-stack React + FastAPI + MongoDB app with a Gemini-powered vision agent and REST API.
- Implemented OpenCV motion detection to gate vision API calls to frames with movement.

Compass – Winner at QHacks | ***FastAPI, pgvector, Supabase, PostgreSQL, React, scikit-learn***

- Built an AI-powered civic dashboard to query 137k+ service requests and generate data-backed analytical reports.
- Designed a RAG pipeline with FastAPI, Supabase, and pgvector, integrating a Gemini agent for trend analysis.
- Implemented UMAP to project 768-dimensional vector embeddings into an interactive 3D cluster visualization.

Blurr – Semifinalist at HackTheNorth | ***FastAPI, OpenCV, WebRTC, React, Python, TypeScript***

- Created a real-time computer vision privacy shield that detects and blurs sensitive information in live video streams.
- Built a low-latency YOLOv8, OpenCV, and WebRTC pipeline achieving **sub-100ms** in-memory video redaction.

Solari – HackThe6ix | ***Python, C, Embedded Systems, QNX, TwelveLabs***

- Developed an AI assistive wearable with real-time audio and haptic feedback for the visually impaired.
- Built a multimodal pipeline with TwelveLabs and Gemini APIs for real-time scene analysis and narration.
- Architected a dual-Raspberry-Pi system isolating QNX for sensor processing and Linux for AI inference.
